OPEN SOURCE SOFTWARE LICENSES EXPLAINED

Avoid legal issues by knowing which open source components are safe for commercial development. Still worried? ActiveState offers indemnification for our Enterprise tier customers.

[Contact us today to learn more](#)

NO LICENSE — None

Unfortunately, without a license, the code is copyrighted by default. Don't use it.

GPL BASED LICENSES — Mostly Copyleft

The simple answer is "do not use with commercial products" since you'll need to share your code base with the community.

ECLIPSE PUBLIC — Mostly Copyleft

It requires source code disclosure and therefore shouldn't be used if you're working on a commercial product.

MOZILLA 2 PUBLIC — Copyleft

Similar to GPL, it requires source code disclosure and therefore shouldn't be used if you're working on a commercial product.

PUBLIC DOMAIN LICENSE — Permissive

Use it! This is one of those rare cases where "free" is actually free.

MIT LICENSE — Permissive

Fair game. Just make sure you distribute a copy of the MIT license terms and the copyright notice with your final product.

BSD-LIKE LICENSES — Permissive

Includes BSD 2 and 3 licenses, all of which are good to use as long as you make sure to include the BSD license and copyright notice.

APACHE 2 LICENSE — Permissive

Make sure you include the copyright, license and any notices, as well as state any changes you made to the original code.

MICROSOFT PUBLIC — Permissive

Just make sure you distribute a copy of the license terms and the copyright notice with your final product.
